

PROJECT PROFILE: MIRAFLEX II DECKING SYSTEM

Miraflex II Waterproof Decking System on Plywood Tabernash, Colorado 2009

Miraflex II systems applied over a plywood deck consist of reinforcement with galvanized metal lath (1). The lath is embedded in polymerized cementitious underlayment (2), followed by a waterproofing membrane, two coats of a polymer modified overlayment (3, 4) and a sealer. The system is a highly decorative waterproofing solution designed to provide a beautiful and durable finish, while protecting the occupied space underneath the deck from water intrusion.
